

# Biogeographic Approach to Coastal Assessments & Spatial Planning

Mark E. Monaco

Mark.Monaco@noaa.gov

# Biogeography to Support Marine Spatial Planning in NOAA's National Marine Sanctuaries

## Developed plan to address:

- Management Plan Revisions
- Environmental Characterizations
- Boundary Evaluations
- Zoning
- Threat Assessment
- Issues of Concern

## Key steps:

- Identify Site Needs Across Multiple Spatial Scales
- Develop a Biogeographic Characterization Plan
- Conduct Joint Biogeographic Characterizations
- Address Future Management Needs and Challenges

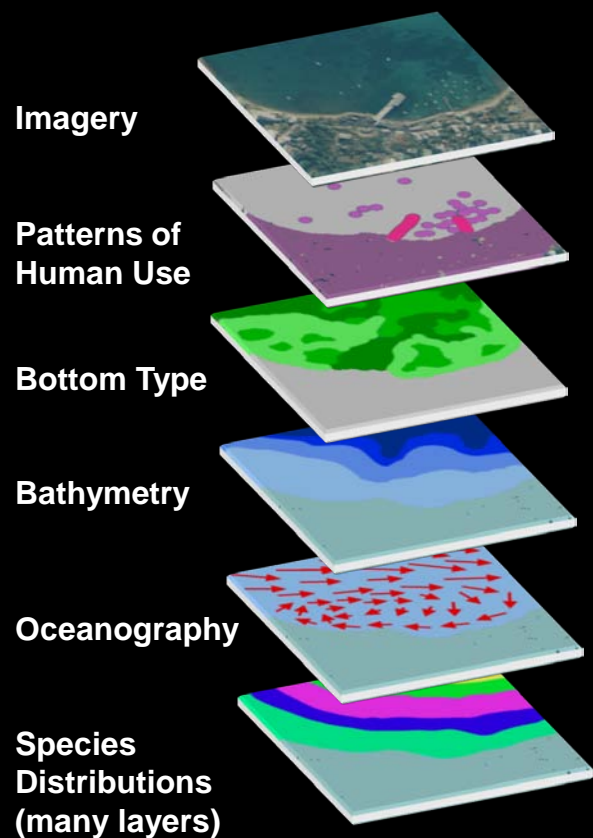

# Biogeography in National Marine Sanctuaries

# Biogeographic Assessment Approach to Support Marine Spatial Planning

## Biogeographic Data Layers

Combine Biogeographic Layers for Analysis

## Example Integrated Biogeographic Analyses\*

\* Specific analyses targeted to management needs

## Products to Aid Management

Evaluate internal zone boundaries relative to biological resources

Explore options for reducing ecosystem threats

Evaluate alternative management strategies

Analytical Products to Meet Management Objectives

# Case Study: Southern California Bight

## A Biogeographic Assessment of the Channel Islands National Marine Sanctuary

A Review of Boundary Expansion Concepts for NOAA's National Marine Sanctuary Program

November 2005

prepared for the  
National Marine Sanctuary Program  
and  
Channel Islands National Marine Sanctuary

### Editors

Randy Clark (NCCOS)  
John Christensen (NCCOS)  
Chris Caldwell (NCCOS)  
Jim Allen (SCCWRP)  
Michael Murray (CINMS)  
Sarah MacWilliams (CINMS)

NOAA Technical Memorandum NOS NCCOS 21

- To produce a quantitative characterization of the distribution of organisms and habitats throughout southern California.
- To evaluate six proposed boundary expansion alternatives under consideration by the Channel Islands National Marine Sanctuary

# Questions Identified

- What data exists to identify ecologically important areas?
- Can we model the distribution of selected species?
- What can these patterns and trends tell us about the biogeography of the region?
- How do these patterns and trends relate to Sanctuary boundary concepts?

Mammals

Fishes

Birds

Habitats

Inverts

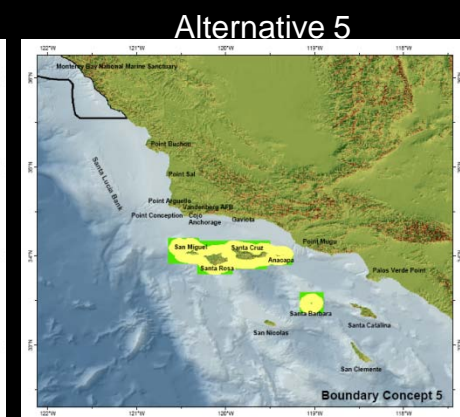

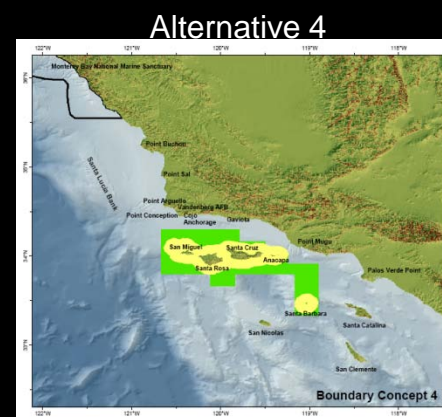

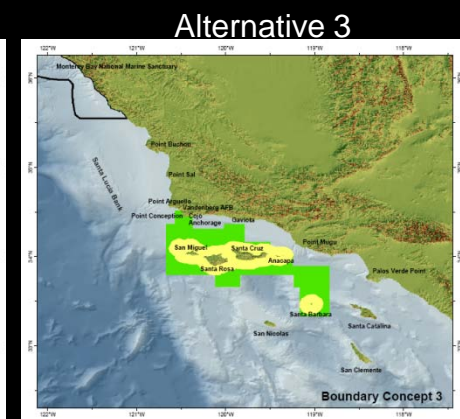

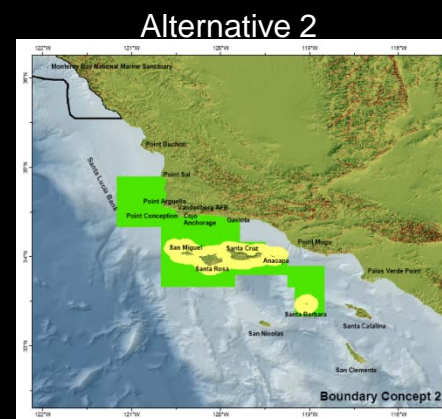

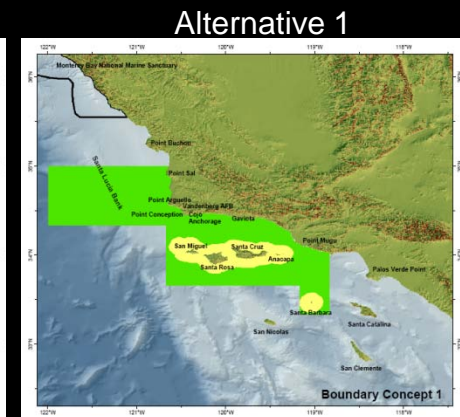

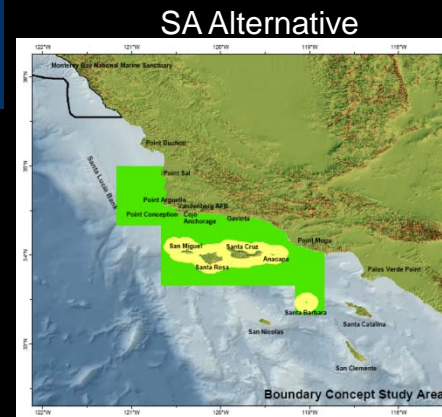

Oceanography

# Boundary Alternatives

- High public interest in the concept of boundary expansion was expressed during 1999 public scoping meetings.
- The management plan review process identified six alternatives, plus a 'no action' alternative for consideration.
- The proposed boundaries would encompass areas ranging from **3,745 km<sup>2</sup>** to **22,613 km<sup>2</sup>**.

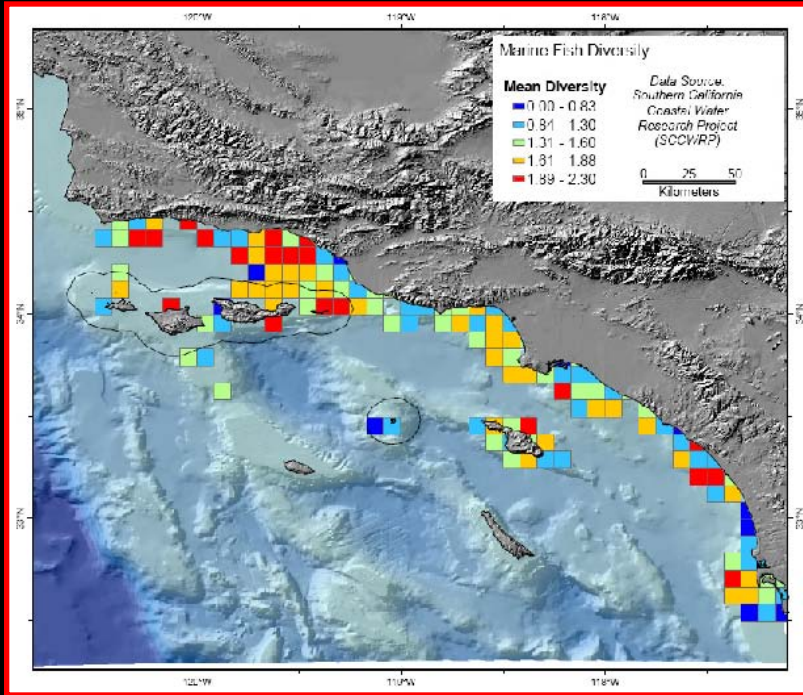

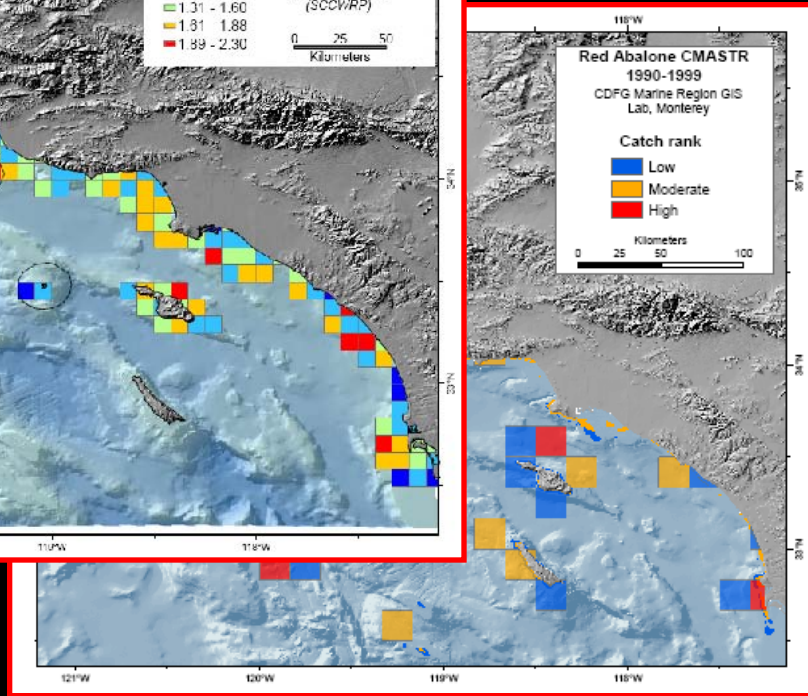

# Biological Data

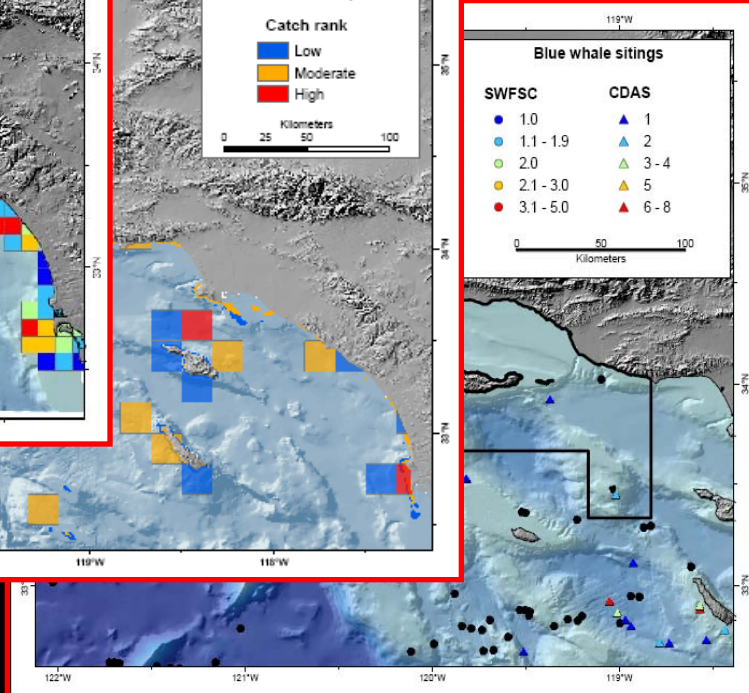

Fishes

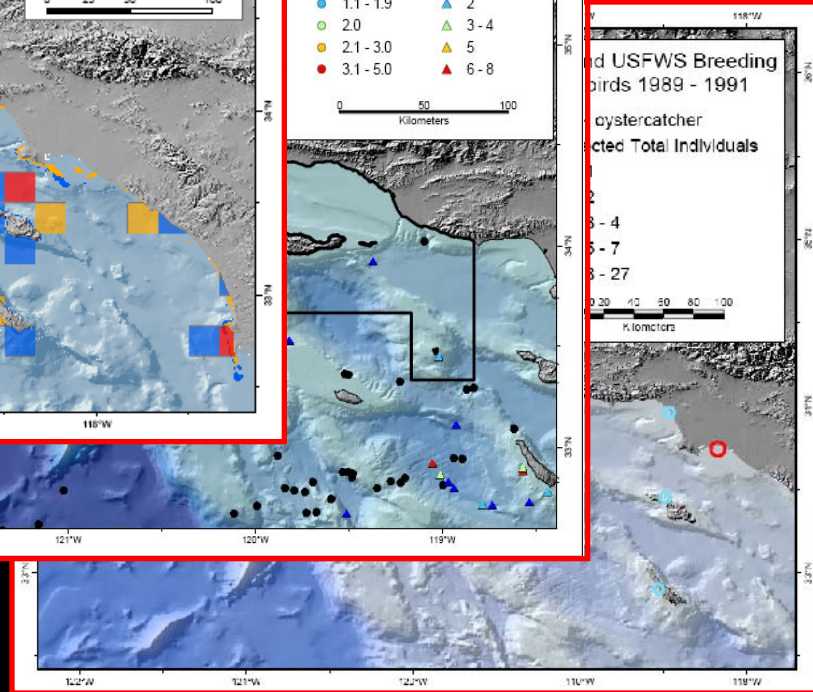

Invertebrates

Marine Mammals

Seabirds/  
Shorebirds

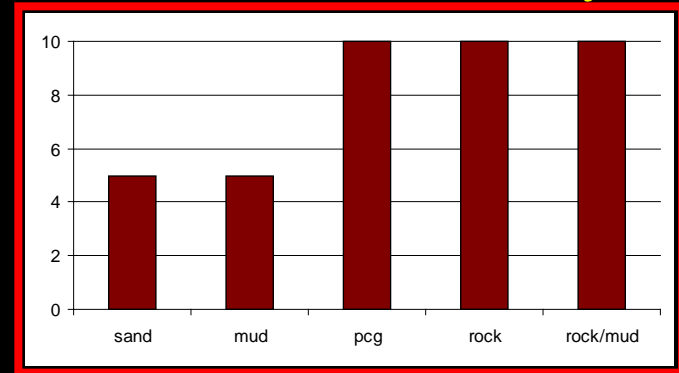

# Modeling to Fill Gaps

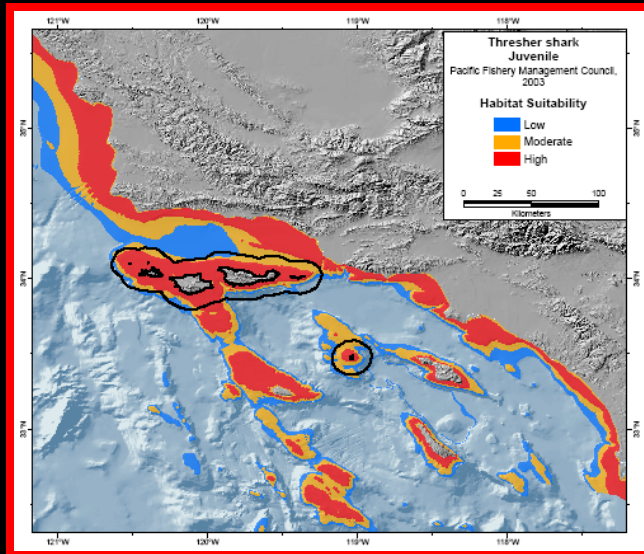

## Bathymetry Suitability

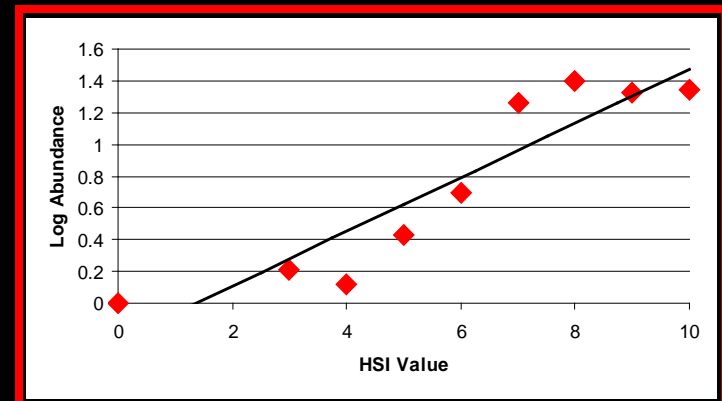

## Substrate Suitability

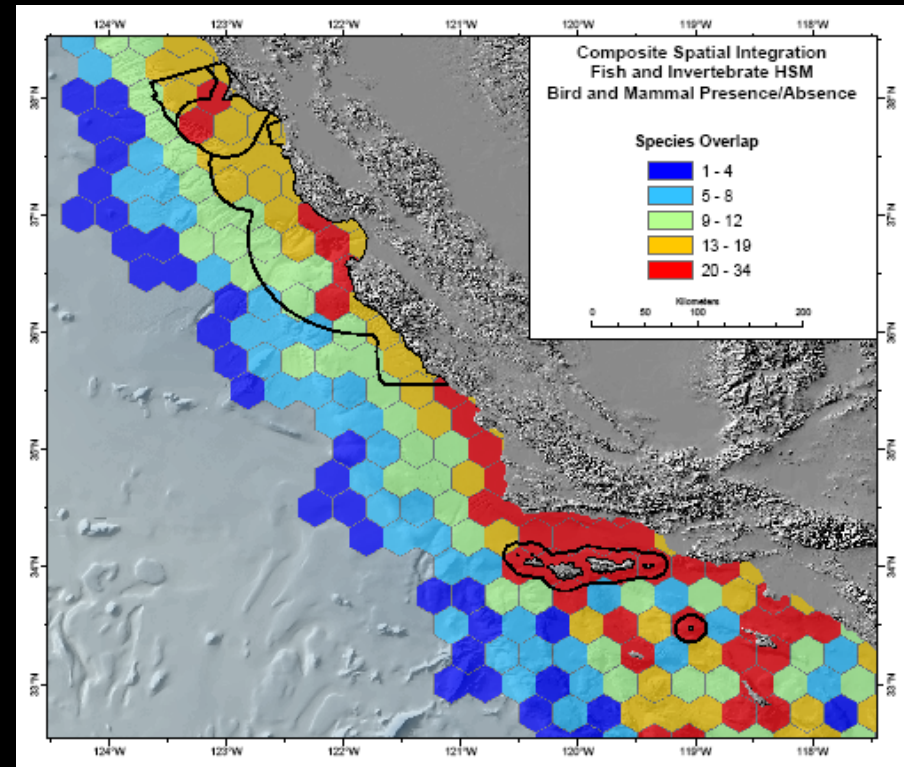

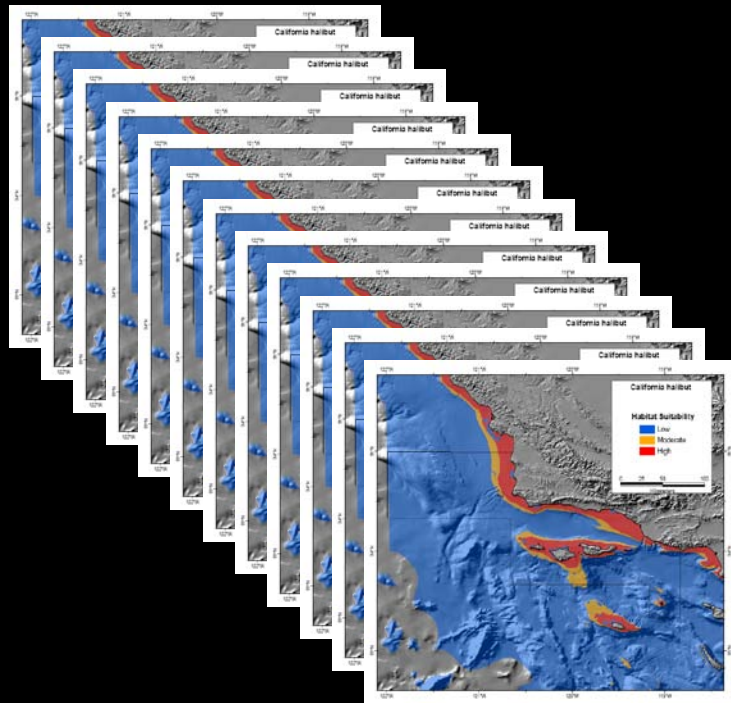

## HSI Results - Validation

## HSI Results - Validation

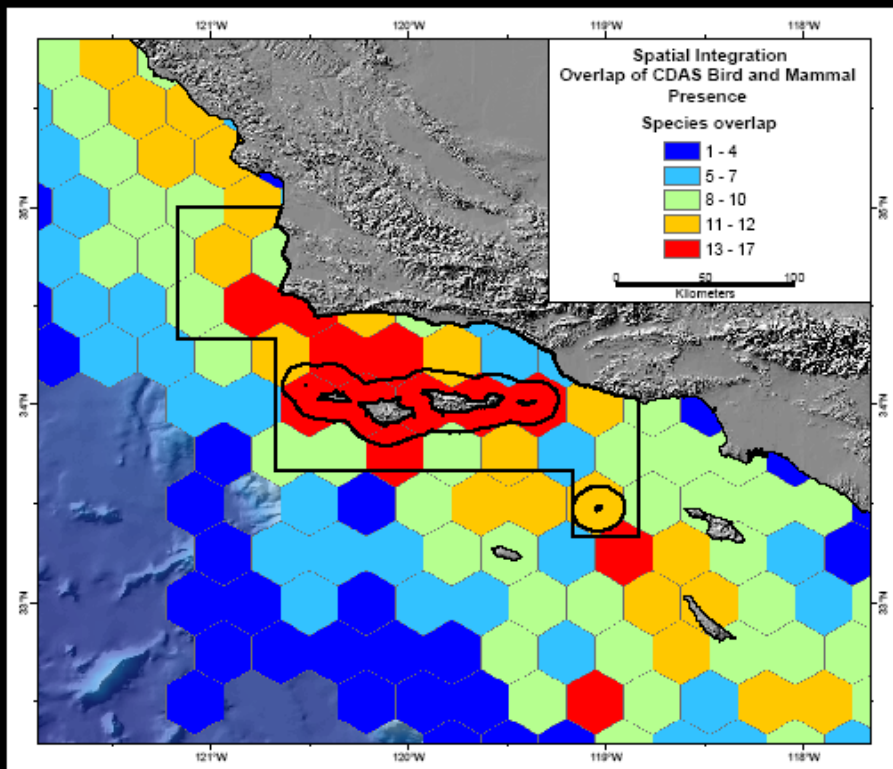

# Regional Patterns

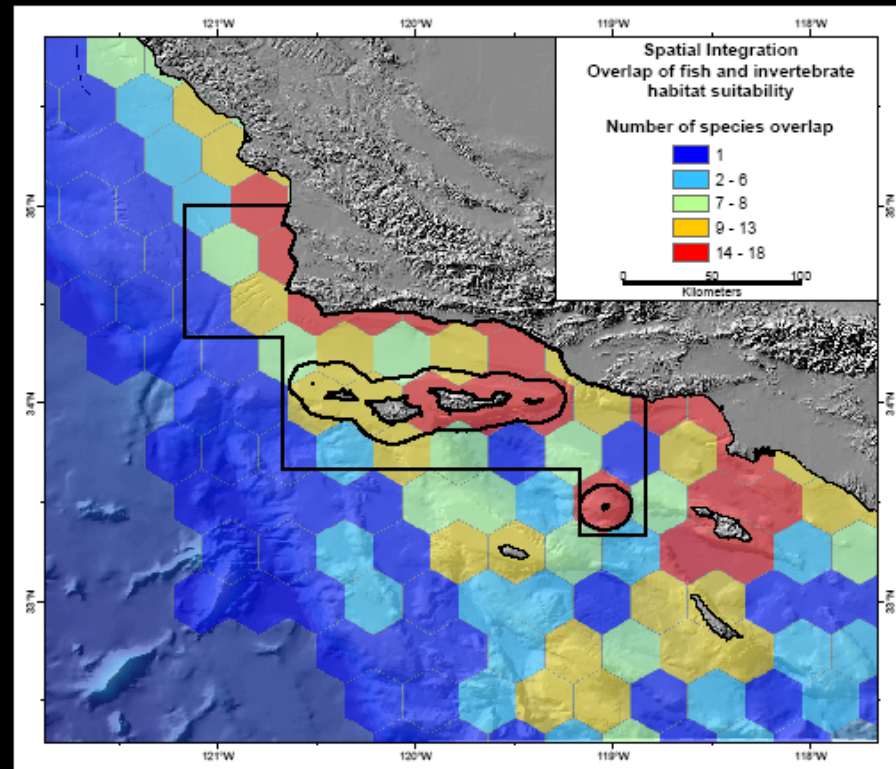

Overlay of spatially concurrent and related data

# Boundary Options

**Study Area Overlain on  
Bird & Mammal Data**

**Study Area Overlain on  
Fish & Invertebrate Data**

***Assessment demonstrated existing CINMS boundary protects key regional marine resources and contributed to planning efforts to establish network of MPAs in CINMS***

# A Biogeographic Analysis of Marine Biological Resources off North/Central California:

## in Support of Revisions to Management Plans for Three National Marine Sanctuaries: Cordell Bank, Gulf of the Farallones and Monterey Bay

1. Does analysis reveal significant spatial and/or temporal patterns in the distribution of marine fauna?
2. Can we model the distribution of selected species to fill information gaps?
3. Are there important ecological areas adjacent to existing sanctuaries?

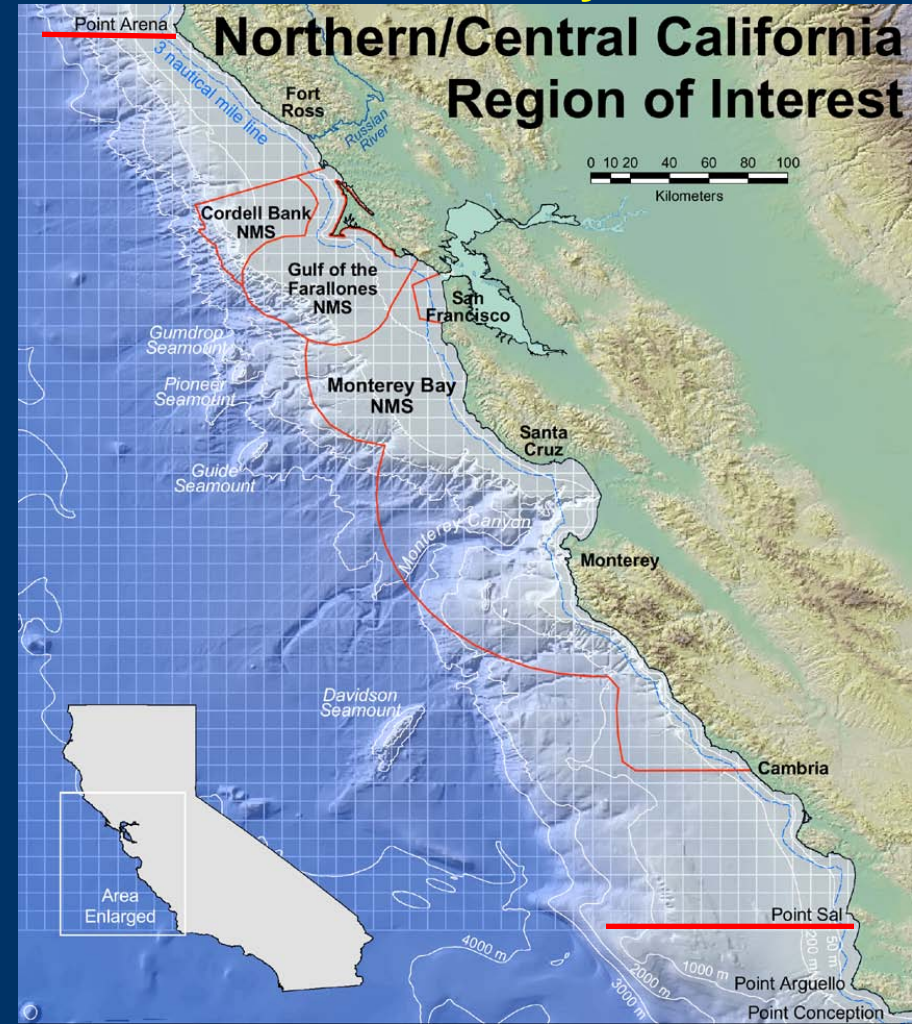

# Central CA Study Area

## Resource Data Layers

- Marine Mammals
- Marine Birds
- Demersal Fishes
- Macro-Invertebrates
- Physical Oceanography
- Habitat (Kelp, Substrate, etc.)
- Physiography

## Integrated Assessments

- Characterizing meso-scale patterns
- Analyzing to identify coincidence in spatial patterns

Mammals

Birds

Fishes

Oceanography

Physiography

# Evaluation of Fish Assemblages Within and Outside National Marine Sanctuary Borders

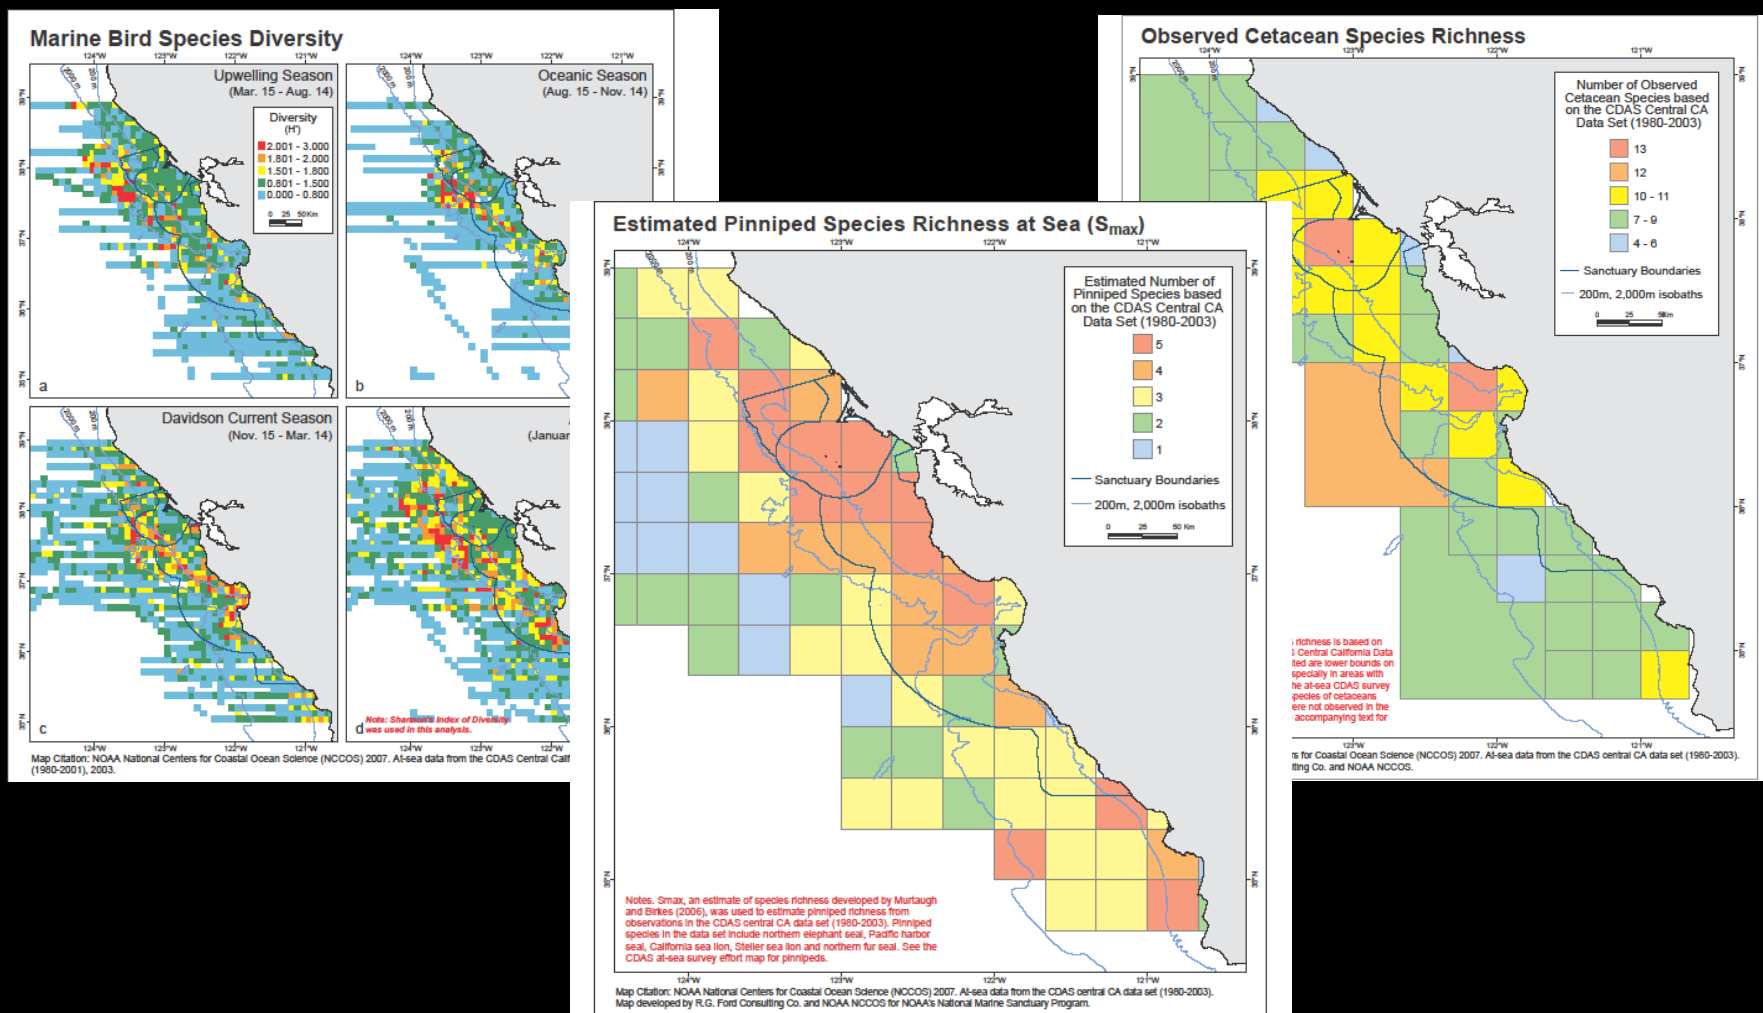

- How many fish assemblages exist within a boundary?
- Can boundaries be optimized to contain most or all assemblages in the region?

- What is the estimated total number of Rockfish species within each boundary?
- Can the boundary be optimized to better manage species in the region?

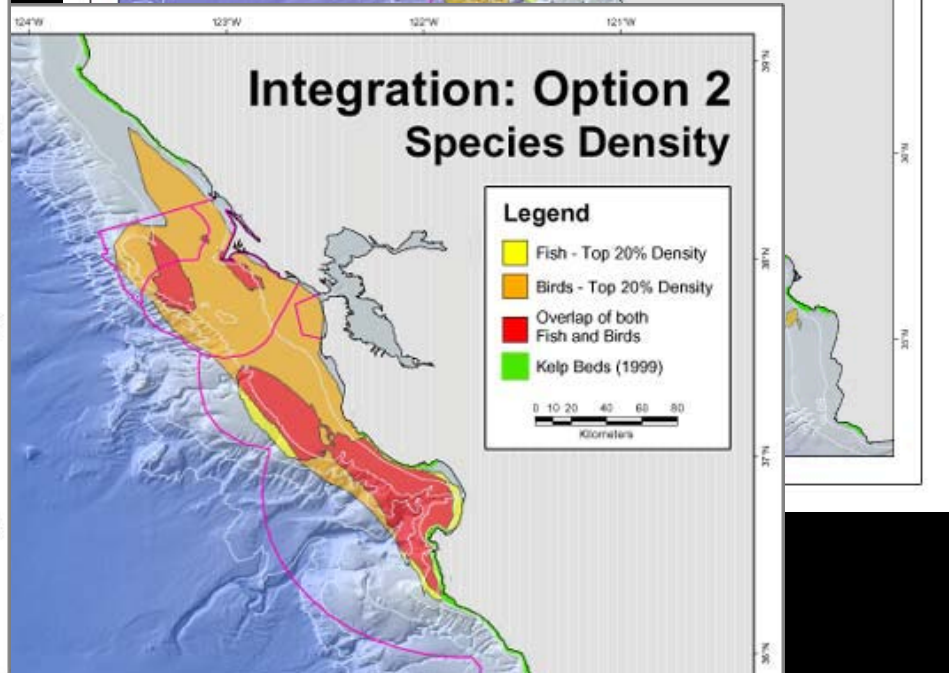

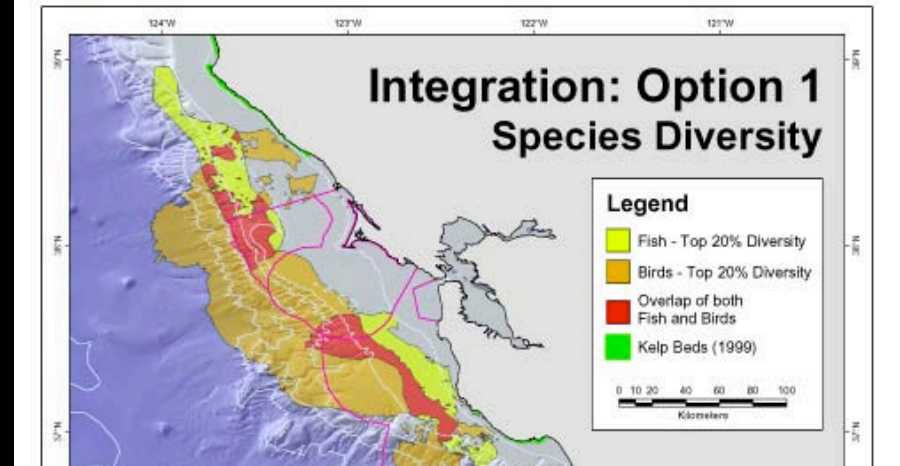

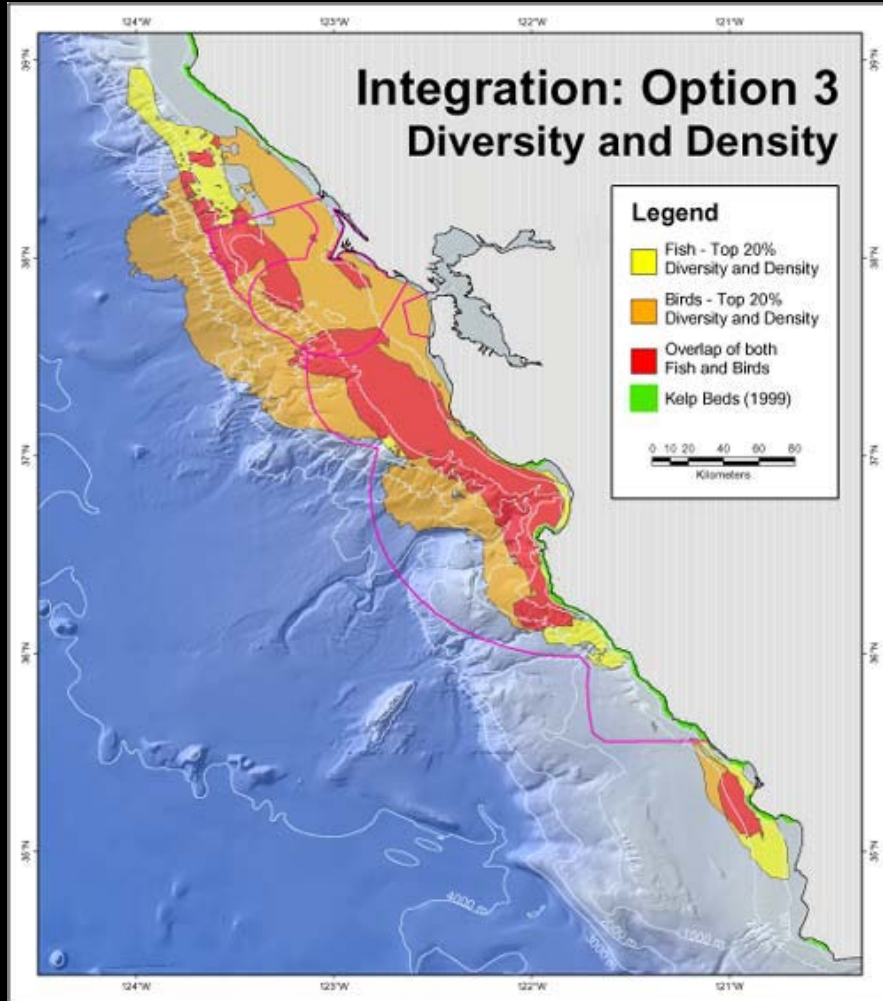

# Diversity of Seabirds and Richness of Marine Mammals off Central CA

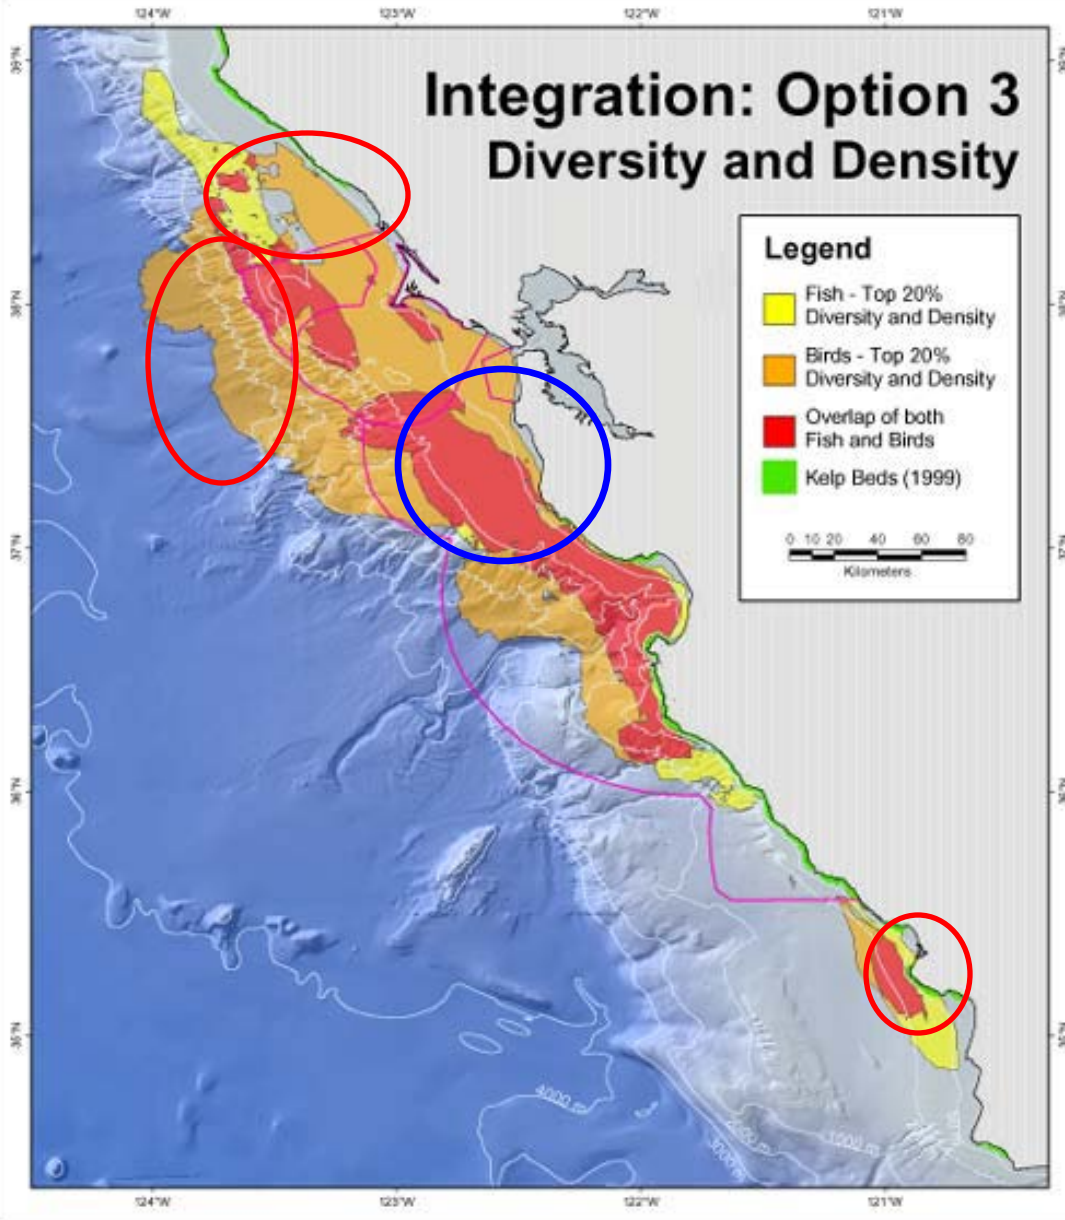

# Integrating Metrics Across Species Groups

## Integrated Assessments to Support Spatial Planning

### Integration: Option 3 Diversity and Density

- Sanctuaries (pink lines) include a large portion of ecologically important areas for marine birds and fishes.
- Areas the north have been suggested for sanctuary expansion. Areas to the west and south also appear significant.
- Some management of the northern “lobe” (blue) of Monterey Bay NMS has shifted to Gulf of Farallones NMS.

# Lessons Learned

- What information is required to develop sound management?
  - Layers related to species distribution (e.g., bathymetry, benthic habitats, etc.)
  - Layers related to human uses and stressors
  - Layers that define ecological connectivity
- How can this information support MSP?
  - Existing data:
    - large scale or multi-disciplinary assessments
    - Allows immediate analysis and provides historical context
  - Synthesis and data collection:
    - Data specifically address questions of interest
    - Collected at appropriate spatial and temporal scales
    - Use local partners for assessment and review

# Partnerships

- California Cooperative Oceanic Fisheries Investigations
- California Department of Fish and Game
- Carter Biological Consulting
- H.T. Harvey and Associates
